

THE 29TH INTERNATIONAL CONFERENCE ON  
ADVANCES IN CRITICAL CARE NEPHROLOGY

# AKI & CRRT 2024

*Jointly Provided by*

UC San Diego  
SCHOOL OF MEDICINE

*and*

CRRT, INC.

MARCH 12-15, 2024

MANCHESTER GRAND HYATT

SAN DIEGO, CALIFORNIA

Session  
A01

## Communication in the Workplace: Conversations in Clinical Encounters

Presented by :  
Marlies Ostermann  
Gita Mehta  
John Michael Maury

# Objectives

1. Examine the principles and value of accepting imperfection.
2. Discuss and practice communication skills that support patient care: deep listening, understanding different perspectives, responding with empathy.
3. Explore emotion through interpretation of non-verbal cues.
4. Review communication skills that assist in difficult conversations.

# Group Agreements

- Observe deep confidentiality
- Share your learnings, please do not share stories of others
- Move up/Move back; Make space for all to participate
- Impact on others is often different from your intention. Inquire about the impact of your words and actions
- Share what you are learning, rather than what you “know”
- Perfection is not possible

# Physician-patient relationship: an evidence-based approach

 **Prepare with intention.**

- Familiarize yourself with the patient you are about to meet.
- Create a ritual to focus your attention before a visit.

Are you prepared for a meaningful interaction?

 **Listen intently and completely.**

- Sit down, lean forward, and position yourself to listen.
- Don't interrupt. Your patient is your most valuable source of information.

What does your patient say when uninterrupted?

 **Agree on what matters most.**

- Find out what your patient cares about and incorporate these priorities into the visit agenda.

What are your patient's health goals, now and in the future?

 **Connect with the patient's story.**

- Consider the circumstances that influence your patient's health.
- Acknowledge your patient's efforts, celebrate successes.

How can you contribute positively to your patient's journey?

 **Explore emotional cues.**

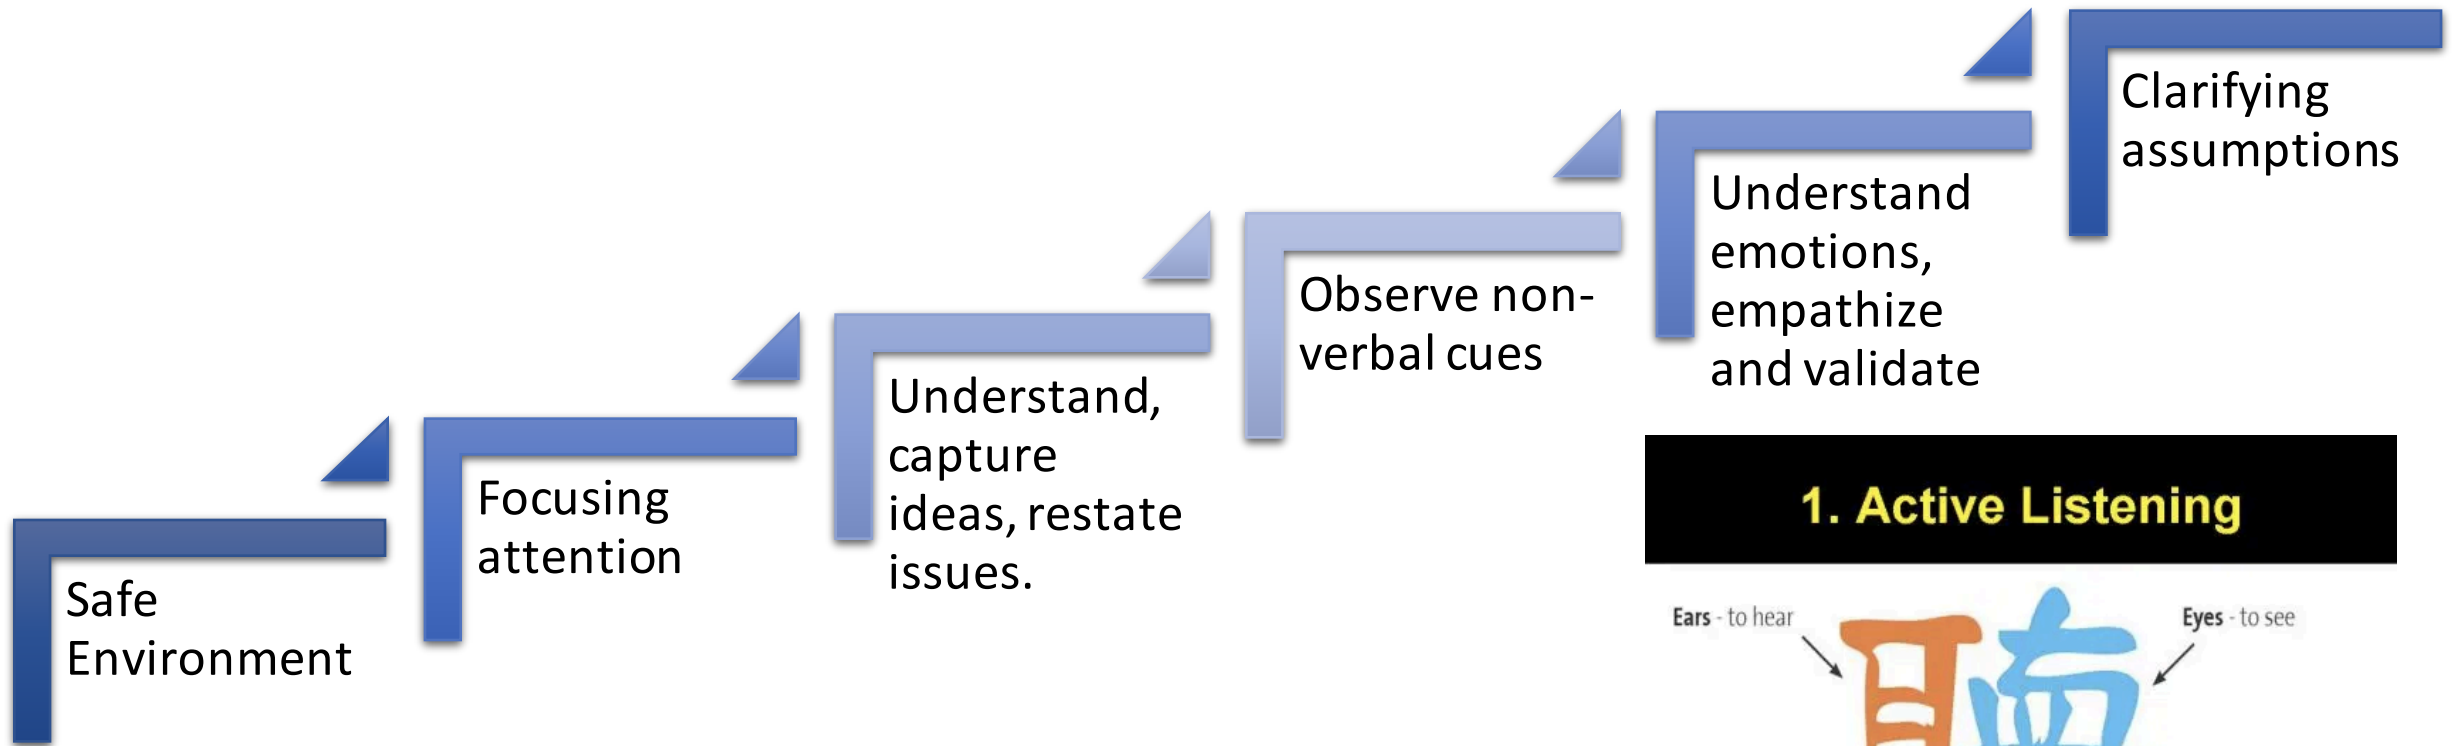

- Tune in. Notice, name, and validate your patient's emotions to become a trusted partner.

What can you learn from your patient's emotions?

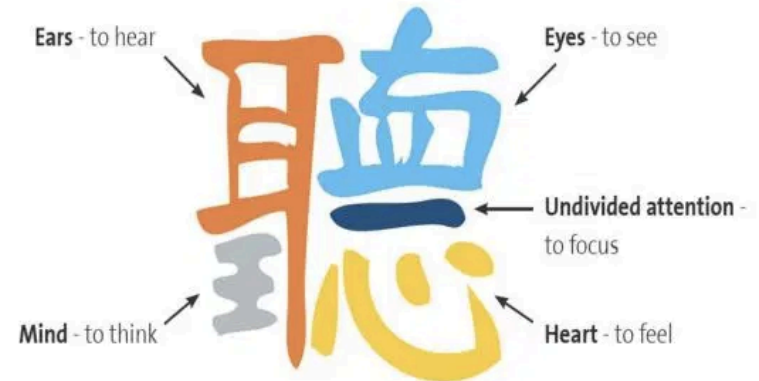

- Reviewed 73 studies of evidence-based interventions that improve pt-clinician experience
- Interviewed physicians in 27 pt encounters
- Patients and physicians identified successful strategies
- Non-medical professionals identified cross-disciplinary practices that foster human connection
- Delphi process to condense 13 practices to 5 recommendations

*Practices to Foster Physician Presence and Connection With Patients in the Clinical Encounter*  
Donna M. Zulman, MD, MS... Abraham Verghese, MD

# What Great Listeners Do

## 1. Active Listening

# Physician-patient relationship: an evidence-based approach

# A model for addressing emotion

---

What  
does this  
look like  
in practice ?

Exploring the  
emotional Cue

- Ask curious questions; eliciting, clarifying, or making an educated guess. Ask about impact, beliefs, triggers

Recognition

- Recognize the expressed emotion

Confirmation/  
Legitimization

- Convey to patient that expressed emotion or challenge is legitimate

Therapeutic Action

- Offer understanding, appreciation/respect, advice, and/or partnership in addressing symptoms, support during care.

# Case for discussion:

A 38 yr old female patient has progressive acute kidney injury due to a flare of lupus. Her potassium level has gradually risen to 6.3mmol/L and she has developed pulmonary oedema. The clinical team feels that she needs dialysis treatment.

The clinical fellow informed her about this decision and explained that a dialysis catheter needed to be inserted into a vein in the neck. The fellow explained the potential risks, including pain, bleeding and a pneumothorax, and re-assured her that catheter insertion was a routine procedure, and he would give her a lot of local anaesthesia so that she would not feel any pain.

During the procedure, the patient was very uncomfortable and restless and found it difficult to lie still. She said that she could not breathe and was feeling pain. The fellow explained that he had given her a lot of local anaesthetic, that she should not feel any pain and that it was important that she kept still. The patient became more restless, said that she could not breathe and asked for the procedure to be abandoned.

The procedure was abandoned. Despite sitting up again, the patient felt breathless. A chest x-ray was performed which showed a pneumothorax.

# Tasks for fellow:

Inform the patient that she developed a pneumothorax as a complication of line insertion.

*Patient asks why this happened.*

Explain the potential reasons (i.e. recognised complication, more common when patient not keeping still etc:)

*Patient asks what will happen next.*

Explain that a chest drain will need to be inserted.

*Patient asks what will happen regarding dialysis.*

Explain that she still needs dialysis treatment and that a catheter will need to be inserted somewhere else, i.e. vein in groin.

*Patient asks why the dialysis catheter was not put into a vein in the groin in the first place.*

Consider abandoning dialysis, and treat hyperkalaemia medically

*Patient questions why she needed the procedure if dialysis was not urgent*

# Debrief questions:

- What “missed opportunities” did you notice for an empathic response?
- What effective communication skills could the fellow have used?
- What would you do differently and why?
